                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   STRAIN=VC1 / DSM 3638 / ATCC 43587 / JCM 8422;
Weiss R.B., Dunn D.M., Robb F.T., Brown J.R.;
"The complete sequence of the Pyrococcus furiosus genome.";
Submitted (FRB-2002) to the EWBL/GenBank/DDBJ databases.
-- SIMILARITY: Belongs to the ribosomal protein L37e family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RL37 PYRHO STANDARD; PRT; 62 AA.

activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXKB and its derivatives selected from XZBBZBXBXB, BXZXB, XBBXZXBX and its derivatives selected from XZBBZBXBXB, BXXZXB, XBBXZXBX and BBXZBBXZ; and (b) a second peptide template XBBX.XBX, XBBXZXBX and elected from the group consisting of XBBXBBX, BXXXBXB, XBBXXXB, ABBXXXBBX, and Capton of XBBXZBXBX, by a selected from the axial capton of XBBZBXXBXBX, by a selected from the axial capton of XBBZXXBBXXBBX; where B = at least one positively charged amino acid; X = at least one aromatic amino acid. and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of The present invention describes an antimicrobial peptide (AP) for direct

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, runcations, extensions, combinations, funions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fungions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial appriate or potentiation and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial for the foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally
                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAV57463 to AAV57557 represent sequences used in the exemplification of the present invention

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against or crivity or for potentiating antimicrobial agents active against or gramisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting cessentially of a first peptide template XZBEBXXB and its derivatives cesentially of a first peptide template XZBEBXXB and BBXZBBX; and (b) a second peptide template XBBXZBB, WXBXXBBX and BBXZBBX; and (b) a second peptide template XBBXXBBX, MXBBXXBBX, MABZXBBX, MABZZBBX, MABZBBX, MABZZBBX, MABZZBBX, MABZZBBX, MABZZBBX, MABZZBBX, MABZZBBX, MABZBBX, MABZZBBX, 
                                                                                                                                                                                                                                                                                                                                                                 ö
                       half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
considered to have undesirable toxicity, immunogenicity and short
                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and funsions; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial agents, agents such as individual antimicrobial against bacteria and fungi, agents in combination with other conventional antimicrobials, agents that enhance the antimicrobial conventions of leukocytes, as disinfectants or preservatives for use in the foods and cosmetics and as agents to improve efficiency of molecular conventions of leukocytes, as disinfectants of profer art have generally been considered to have undesirable toxicity, immunogenicity and short convention natural antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short convention natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibicitic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     bacterial infection; fungal infection; fungicide; disinfectant;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against conganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZXEBXB and its derivatives selected from XZBZZXBX. BXZXZBX XBBXZXBBX and BBXZBBXZ; and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, RBBXXBBX, XBBXZXBB, and (b) as the least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of infections.
overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAX57557 represent sequences

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers,
truncations, extensions, combinations, funions and their derivatives. The possible structures are fully described in the specification. Also concluded are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fungion; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial agents (2) antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial activity of functions of leukocytes, as disinfectants or preservatives for use in commercional antimicrobial peptides of protentiate or restore efficacy of foods and cosmetics and as agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in commercions and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic creatstance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness due to biodegradation, recipience prepages of the present sequence is a rabbit pWP based antimicrobial peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                       Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection, fungicide, disinfectant, preservative, foods, cosmetic, multiple antibiotic resistance, rabbit,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                              Rabbit platelet microbicidal protein, PMP-2, based peptide #6

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXEBXB and its derivatives selected from XZBBZBXBXB, BXXXXXB, XBBXXBBXB and BBXZBBXZ; and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXBBX, and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and contain acid, and where B = at least one positively charged amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7463 to AAXS757 represent sequences used in the exemplification of the present invention

Sequence 14 AA

1 ALYKKFKKKLLKS 13

셤

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide contentining a 7-13 amino acide core sequence (desirved from PMP-1 and PMP-2, platelet microbicalal protein), and retromers.

Every sequence sere fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents bacteria and fungi, agents in combination with other antimicrobial peptides and seafors that enhance the antimicrobial armicrobials, agents that enhance the antimicrobial for conventional antimicrobials, agents to improve efficiency of molecular conventions of leukocytes, as disinfectants or preservatives for use in the foods and cosmetics and as agents to improve efficiency of molecular belongy techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibictic resistance. They exhibit lower inherent mammalian cell toxicities and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                 Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2;

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXXBXS and BRXZBXZing selected from the group consisting a second peptide template XBZXB, XBXXBXS, XBXXBXS, AM (BXZBBXZBXZ) and (b) a second peptide template XBBXXBBX, XBXXBXXB, XBXXBBX, and their derivatives selected from the group consisting of XBBXXBBX, XBBXXBBX, BBXZBBX; where B = at least one positively charged amino acid, at least one non-polar hydrophobic amino seld; Z = at least one aromatic amino acid, and where B, and Z may be separated by one or more other camino acids. The peptides can be used to treat bacterial and fungal amino acids. The peptides also increase the antimicrobial activity of intections. The peptides overall effect cellular disruption and rapid application of application and rapid application of application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid application and rapid ap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gapa

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBKB and its derivatives selected from KXBBZBRXB, BXXZXB, XBBXZXBB, and BBXZBBXZ; and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXZXBB, and consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXBBX, BAXZBB, and ABZBXBBX, where B = at least one positively charged amino acid; X = at least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AX57463 to AAX5757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection, fungicide, disinfectant, preservative, foods, cosmetic, multiple antibiotic resistance, rabbit,

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers.

Cruncations, extensions, combinations, funions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, combinations of the peptides described above, and retromers, extensions, such as bacteria and fungion; and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial for the foods and cosmetics and as agents to improve efficiency of molecular (cods and cosmetics and as agents to improve efficiency of molecular (cods and cosmetics and as agents to improve efficiency of molecular considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that that half-lives and considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that the partial and considered to have undesirable exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicity and short or effective proper due to hidder the entition of effective and produced and considered where the entition of effective and an approach and produced and considered 
                                                                                                                                                                                                                                                                                                                                                                New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acida contening a 7-13 amino acid acore sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and recromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as or for potentiating antimicrobial agents active against organisms such as core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents that enhance the antimicrobial for use in foods and cosmetics and as agents to improve efficiency of molecular considered to have undestrable to private art have generally been considered to have undestrable to fire private in memoral considered to have undestrable to fire private in the constant to the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the constant of the

                                                                                                                                                                                                                                                                                                                                                                    New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibitotic resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide

activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide estantially of a first peptide template XEBZENKER and its derivatives selected from XEBZENKER, BXXXE, XEBZENKER and its derivatives selected from XEBZENKER, BXXXE, XEBZZENKER and BENZENKZ; and (b) a second peptide template XEBXX and their derivatives selected from the group consisting of XEBXENK, and their derivatives selected from the group consisting of XEBXENKER, BXXENXE, XEBZXENE, and (b) at least one positively charged amino acid; x at least one aromatic amino acid, and where B, x and Z may be separated by one or more other infections. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAVS7463 to AAVS7557 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an antimicrobial peptide (AP) for direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.
Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      . .

activity or for potentiating antimicrobial agence active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZENENE and its derivatives selected from XZBZENENE, BXZXZB, XBBXZXBENE and its derivatives selected from XZBZENENE, BXZXZB, XBBXZXBEN, and BBXZBBXZ, and (b) a second peptide template XBBX and their derivatives selected from the group consisting of XBBXENENE, and XBBXXBBN, BXXBXB, XBBXZXBB, and (b) at least one positively charged amino acid; at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal ninfections. The peptides overall effect cellular distription and rapid apoptosis of microbial cells. AAVS7567 represent sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                           The invention relates to an antimulational peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from
150 amino acids containing a 7-13 amino acid core sequence (derived from
150 amino acids containing a 7-13 amino acid core sequence (derived from
150 amino acids containing a 7-13 amino acid core sequence (derivatives from
150 amino PMP-1 and PMP-2, platelet microbical protein), and retromers,
150 core for potentiating antimicrobial agents active against organisms such as
151 core sequence selected from truncations of the peptides described above,
152 core sequence selected from truncations of the peptides described above,
153 core sequence selected from truncations of the peptides described above,
154 containing an amino acid
155 core sequence selected from truncations of the peptides described above,
156 core sequence selected from truncations of the peptides described above,
157 core sequence selected from truncations of the peptides described above,
158 core sequence selected from truncations and fusions; and (2)
159 core sequence selected from truncations and fusions; and (2)
150 core sequence selected from truncations and fusions, and (2)
150 core sequence selected from truncations and fusions, and (2)
150 core sequence selected from truncations and fungi. The
150 core sequence against bacteria and fungi, agents in combination with other
151 conventional antimicrobials, agents that enhance the antimicrobial
150 core sequence to have undesirable to improve efficiency of molecular
151 considered to have undesirable to improve efficiency of molecular
151 considered to have undesirable toxicity, immunogenicity and short
151 considered to have undesirable toxicity, immunogenicity, and short considered to have undesirable toxicity, immunogenicity, and short considered to have to biodegradation. The peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibials of toxicity, immunogenicity, and short core problems of toxicity, immunogenicity, and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                           peptide composition for the prevention and treatment of by organisms, such as bacteria and fungi, exhibiting
                                                                                                                                                                                                                       invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence is that of Protide-1 (PT-1), a peptide antibiotide with distinct effector and activator domains. PT-1 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokina-like peptide effector (Interleukin-8 domain) and an activator site specific peptide effectors in the presence of VB protease. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the presence of VB protease. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the presence of VB protease produced by Staphylococcus ansueus. Thus, PT-1 was designed to exert optimal antimicrobial activity in the context of infections due to staphylococcal cells elaborating the virulence factor WB protease. PT-1 was synthesised by Solid-phase synthesis It is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

activity or for potentiating antimicrobial agents active against corganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XBBXZBBXB and its derivatives selected from XZBBZBXBB, BXZXB, BXZXZB, XBBXZBBX and BBXZBBXZ; and (b) a second peptide template XBBXXBB, BXXBXBBX and BBXZBBXZ; and (b) group consisting of XBBXBBX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, BXXBXBB, and XBBXXBBXXBBX, WBBXXBBXXBBX, and a least one non-polar hydrophobic amino acid; Z = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acid, and where B, X and Z may be separated by one or more other amino acid, and where B, X and Z may be separated by one or more other amino acid, and peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAX57537 to AAX57537 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                         invention describes an antimicrobial peptide (AP) for direct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           bacterial infection; fungal infection; fungicide; disinfectant;
preservative; foods; cosmetic; multiple antibiotic resistance; rabbit.
                                                                                                                              Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rabbit platelet microbicidal protein, PMP-2, based peptide #33.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 53; DB 2; Length 35;

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbical protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, antimicrobial peptides for potentiatings antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobials agents that enhance the antimicrobial agents that enhance the antimicrobial attimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and commettes and as agents that enhance the antimicrobial peptides of prior art have generally believely techniques, antimicrobial peptides of prior art have generally believely.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                    been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present sequence is that of Protide-2 (PT-2), a peptide antibiotide with distinct effector and activator domains. PT-2 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (interleukin-8 domain) and an activator site specific cordinates, a complement fixing protease. PT-2 is cleaved into 2 distinct effectors in the presence of C3 convertase. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the presence of C3 convertase. PT-2 was designed to exert optimal antimicrobial activity in PT-2 was designed to exert optimal activity in the context of activation of one of the inner end activity in the context of activation of one of the context-activated protides of the innate immune response to antigen exposure. PT-2 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more effectors with individual distinct biological functions and one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory Claim 1; SEQ ID NO 2; 103pp; English range of pathological conditions.

New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory condition.

with distinct effector and activator domains. Pr.3 contains a C-remainal antimorcobial peptide effector (RP-1), an N-terminal chemokine-like peptide effector (RP-1), an N-terminal chemokine-like peptide effector (Interleukin-8 domain) and an activator site specific for thrombin. Pr-3 was designed to be cleaved into 2 distinct effectors in the presence of thrombin. In particular, it was designed to exert antimicrobial activity less than that of RP-1 in the absence of thrombin. Thus, PT-3 exerts optimal antimicrobial activity in the context of thrombin as would be present in the setting of vascular injury or infection. PT-3 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one or more corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a broad range of pathological sequence is that of Protide-3 (PT-3), a peptide antibiotide Claim 1; SEQ ID NO 3; 103pp; English. conditions

New context-activated protide, useful for vascular injury, neoplastic condition, microbial infection, decreased cell death or inflammatory condition

Claim 1; SEQ ID NO 4; 103pp; English.

The present sequence is that of Protide-4 (PT-4), a peptide antibiotide with distinct effector and activator domains. PT-4 contains a C-terminal antimicrobial peptide effector (RP-1), an N-terminal chemokine-like

```
peptide effector (interleukin-8 domain) and an activator site specific for matrix metalloproteinase MMP-9, which is produced to dissolve the tissue in front of the growing blood vessel tip to allow for its continued tissue invasion. PT-4 was designed to be cleaved into 2 distinct effectors in the presence of MMP-9. In particular, PT-4 exerts antineoplastic and/or antimicrobial activity less than that of RP-1 in the absence of MMP-9, but equivalent to or exceeding that of RP-1 in the presence of MMP-9, thus, PT-4 exerts optimal antineoplastic and/or antimicrobial activity in the context of new blood vessel formation. PT-4 is an example of context-activated protides of the invention that have 2 or more effectors with individual distinct biological functions and one corresponding activator sites that can each initiate or amplify the biological function of one or more effectors upon context activation. The protides are useful in the diagnosis, prophylaxis and therapy of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         broad range of pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 39 AA;

New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.

ŏ

Example; Page 67; 221pp; English.

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acids containing a 7-13 amino acide sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as ABG69990

```
bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and funsions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukcoytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, bacteria and fungi, agents in combination with other antimicrobials, agents that enhance the antimicrobial agents of conventional antimicrobials, agents that enhance the antimicrobial functions of leukcoytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides of prior art have generally care based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic conservations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
